Causal Diagrams in R

Malcolm Barrett

RStudio, PBC

2021-09-01 (updated: 2022-10-16)

Draw your causal assumptions with causal directed acyclic graphs (DAGs)

The basic idea

- Specify your causal question
- Use domain knowledge
- Write variables as nodes
- Write causal pathways as arrows (edges)

ggdag

dagitty

ggplot2 ggraph

dagitty

ggplot2 ggraph

powerful,
 robust
algorithms

dagitty

powerful, robust algorithms

ggplot2 ggraph

unlimited flexibility

beautiful plots

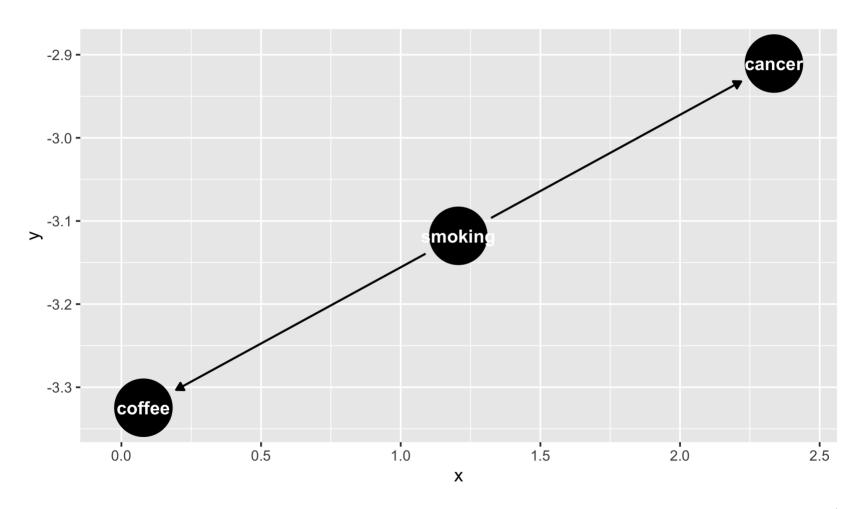

```
dagitty
           ggplot2
           ggraph
       Data
    structure:
     tidy DAGs
```

```
dagify(
  cancer ~ smoking,
  coffee ~ smoking
)
```

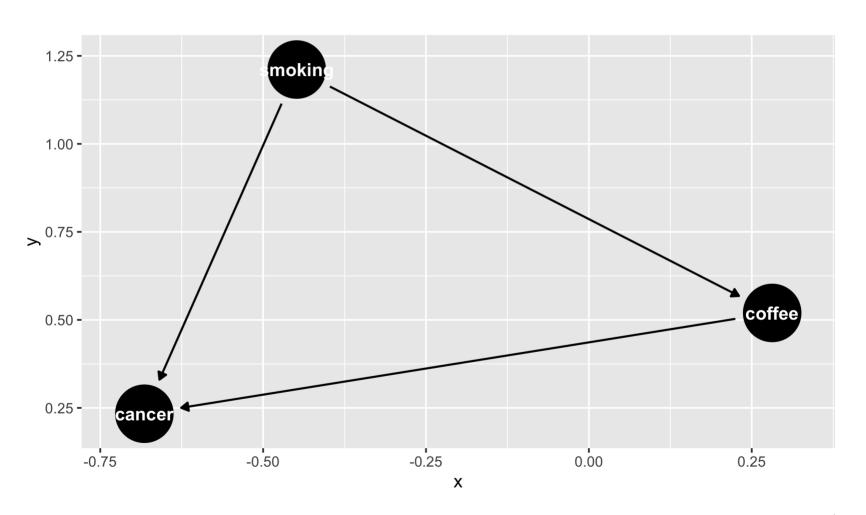

```
dagify(
  cancer ~ smoking,
  coffee ~ smoking
)
```

```
dagify(
  cancer ~ smoking,
  coffee ~ smoking
)
```

```
dagify(
  cancer ~ smoking,
  coffee ~ smoking
) %>% ggdag()
```

```
dagify(
  cancer ~ smoking + coffee,
  coffee ~ smoking
) %>% ggdag()
```

Your Turn 1 (04-dags-exercises.Rmd)

Specify a DAG with dagify(). Write your assumption that smoking causes cancer as a formula.

We're going to assume that coffee does not cause cancer, so there's no formula for that. But we still need to declare our causal question. Specify "coffee" as the exposure and "cancer" as the outcome (both in quotations marks).

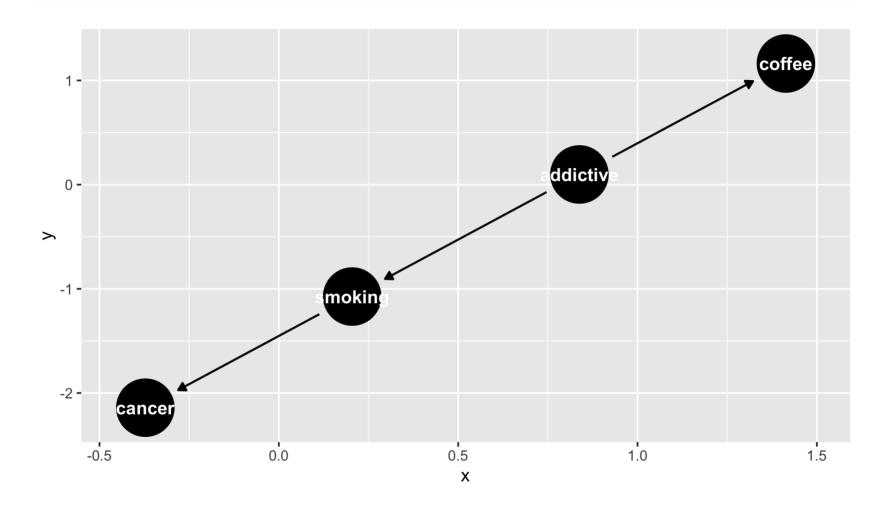

Plot the DAG using ggdag()

Your Turn 1 (02-dags-exercises.Rmd)

```
coffee cancer dag <- dagify(</pre>
  cancer ~ smoking,
  smoking ~ addictive,
 coffee ~ addictive,
 exposure = "coffee",
 outcome = "cancer",
 labels = c(
    "coffee" = "Coffee",
    "cancer" = "Lung Cancer",
    "smoking" = "Smoking",
    "addictive" = "Addictive \nBehavior"
```

ggdag(coffee_cancer_dag)

Ok, correlation != causation. But why not?

Ok, correlation != causation. But why not?

We want to know if x -> y...

Ok, correlation != causation. But why not?

We want to know if x -> y...

But other paths also cause associations

ggdag_paths()

Identify "backdoor" paths

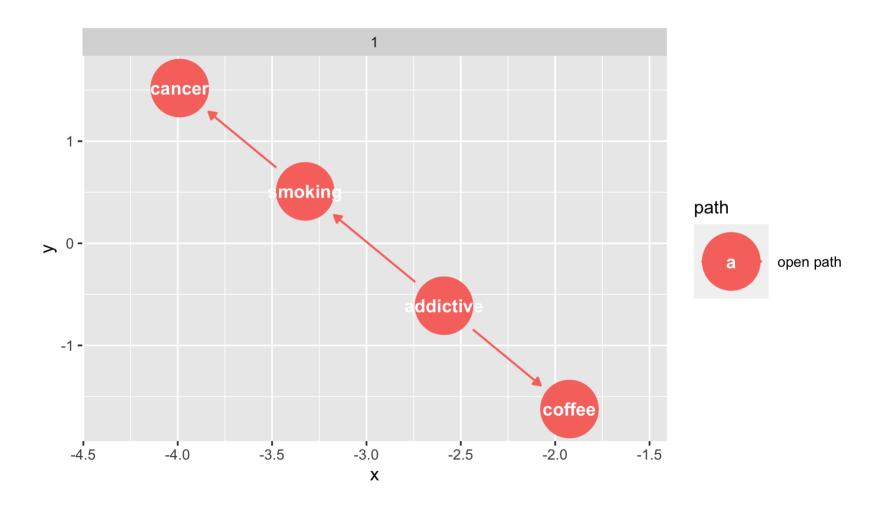

ggdag_paths(smk_wt_dag)

Call tidy_dagitty() on coffee_cancer_dag to create a tidy DAG, then pass the results to dag_paths(). What's different about these data?

Plot the open paths with ggdag_paths(). (Just give it coffee_cancer_dag rather than using dag_paths(); the quick plot function will do that for you.)
Remember, since we assume there is no causal path from coffee to lung cancer, any open paths must be confounding pathways.

```
coffee cancer dag %>%
  tidy dagitty() %>%
  dag paths()
## # A DAG with 4 nodes and 3 edges
### ##
## # Exposure: coffee
## # Outcome: cancer
### ##
## # A tibble: 5 × 11
#非 set name
                       y direction to xend yend
                     Χ
## <chr> <chr> <dbl> <dbl> <fct> <chr> <dbl> <dbl> <
## 1 1 addictive 0.494 2.00 -> coff... -0.423 2.81
## 2 1 addictive 0.494 2.00 -> smok... 1.50 1.11
## 3 1 cancer 2.41 0.310 <NA> NA
                                                NA
## 4 1 coffee -0.423 2.81 <NA> NA NA
## 5 1 smoking 1.50 1.11 -> canc... 2.41 0.310
## # ... with 3 more variables: circular <lgl>, label <chr>,
### ##
     path <chr>
```

coffee_cancer_dag %>%
 ggdag_paths()

We need to account for these open, non-causal paths

We need to account for these open, non-causal paths

Randomization

We need to account for these open, non-causal paths

Randomization

Stratification, adjustment, weighting, matching, etc.

Identifying adjustment sets

ggdag_adjustment_set(smk_wt_dag)

Identifying adjustment sets

```
library(dagitty)
adjustmentSets(smk_wt_dag)
```

```
## { active, age, education, exercise, race, sex, smokeintensity, ## smokeyrs, wt71 }
```

Now that we know the open, confounding pathways (sometimes called "backdoor paths"), we need to know how to close them! First, we'll ask {ggdag} for adjustment sets, then we would need to do something in our analysis to account for at least one adjustment set (e.g. multivariable regression, weighting, or matching for the adjustment sets).

Use ggdag_adjustment_set() **to visualize the adjustment sets. Add the arguments** use_labels = "label" **and** text = FALSE.

Write an R formula for each adjustment set, as you might if you were fitting a model in lm() or glm()

```
ggdag_adjustment_set(
  coffee_cancer_dag,
  use_labels = "label",
  text = FALSE
)
```

```
cancer ~ coffee + addictive
cancer ~ coffee + smoking
```

Let's prove it!

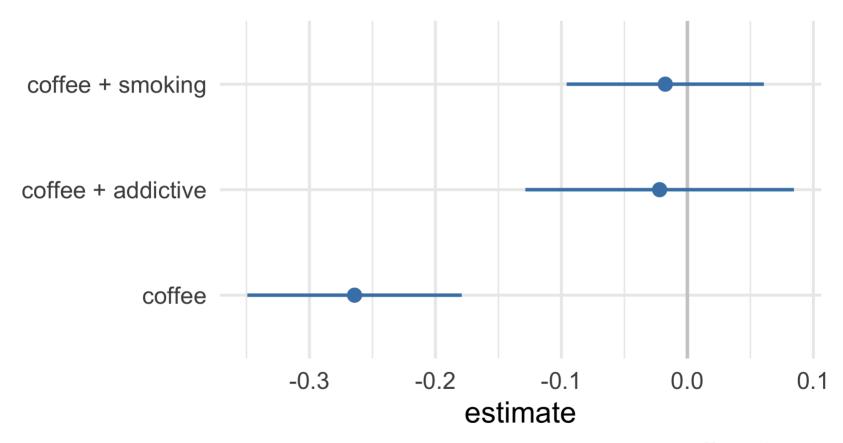

```
set.seed(1234)
dag_data <- coffee_cancer_dag |>
  simulate_data(-.6)
```

Let's prove it!

dag_data

```
