The three practices of analysis

1 **Describe**

2 **Predict**

3 **Explain**

Normal regression estimates associations. But we want **counterfactual, causal** estimates:

What would happen if **everyone** in the study were exposed to x vs if **no one** was exposed.

For causal inference, we need to make sometimes unverifiable assumptions.

Today, we'll focus on the assumption of **no confounding**.

Tools for causal inference

1. **Causal diagrams**

2. **Propensity score weighting**

3. **Propensity score matching**

Other tools for causal inference

1 **Randomized trials**

2 **G-methods & friends**

3 **Instrumental variables & friends**
